8 SURASPRING

Machine tools and production systems

Precision, process reliability, and productivity thanks to robust system solutions and components

HEMA components protect machines and operators effectively and efficiently against flying chips, cooling lubricants, and injury from moving parts.

We raise the service life and availability of the machine and keep the operator safe from harm.

Laser cutting machines

Optical waveguides or deflecting mirrors guide laser beams to the machining optics. The beam path is protected with special bellows particularly on machines with moving optics.

Machine tools for nonmetals

Special materials are matched to the requirements of non-metal machining types.

These can be for instance slats for the optimal protection against sharp chips or particularly smooth surfaces of teflon material for the enhanced runoff of powdery removal.

Testing and measuring systems

In the test room the task is to find the μ under climate controlled conditions. A low noise and low friction process coupled with a low compressing counterpressure are only two of the requirements for our bellows and shutter systems. Perfect systems, the optimal surface feel, and tight tolerance designs are the specifications for our production and quality assurance standards.

Robotics, automation, and handling

We utilise high strength materials with superior flex fatigue properties that safeguard fast, precise traverses on linear guide rails and the greatest possible flexibility for special designs.

Here we can provide the corresponding supplements to our rail and rod clamping systems.

INNOVATION NEVER ENDS.

For more than forty years we have been manufacturing protective systems for the world's machinery building sectors. Our first products were bellows and coil springs that we produced in Seligenstadt, which is still our head office today. Through consistent further development our range of bellows as protective covers for guides evolved into the SAMURAI product series with slat reinforced bellows and aprons and complete rear wall systems. Our spiral springs were joined by other product ranges like telescopic steel covers, shutter covers, segmented aprons, machine safety screens, and Visiport spin windows that today supplement our range of offers.

Our second field of competence concentrates on pneumatic clamping and braking systems for linear and rotary clamping. You can view extensive information on these products in an additional catalogue we have put together for you.

This product diversity is possible only with extensive research and development as well as intensive detailed work. In close collaboration e.g. with the Production Management, Technology, and Machine Tools Institute (PTW) at the Darmstadt University of Applied Sciences developments and structures are tested for their practicability and extreme situations simulated so that our products can also fulfil the high requirements in the field. This successful collaboration was crowned with the First Hesse Cooperation Award in 2005.

We also collaborate closely with other external institutes like the Production Engineering and Machine Tools Institute (IFW) at the Berlin University of Applied Sciences. By means of impact tests on protective covers and machine safety screens we assure their suitability for applications in machining environments. In addition we conduct extensive material and function tests at our location. The following pages present a selection.

Our own product and process quality is verified by regular certification procedures: all of our European production locations have been awarded DIN ISO 9001:2015 certifications. Kaizen teams at all works contribute towards continuous improvement.

What we can offer you:

extensive product knowhow and own production competence

- sheet metal working on thicknesses from 0.1 to 10 mm, CNC machining, precision grinding
- special plastics knowhow for pleating, milling, and welding at our own production locations
- high level of engineering competence for protective covers, end to end solutions, mechatronics, handling, and automation

low cost production for attractive prices

- state of the art production technologies and cost optimised production processes
- world spanning production sites in Germany, Romania, and China
- global materials purchasing and tightly channelled purchase quantities

standards for safeguarding conformity

- fulfilment of international standards
- unified quality management system under DIN ISO 9001:2015
- compliance with ROHS, REACH, and safety standards
- collaboration in the development of safety standards

international supervision on site and on the web

- consultation with competent marketing technicians and project engineers
- worldwide commissioning and services
- the latest production information on the web for your current order
- all available documents can be retrieved online: catalogues, request and order forms, certificates, etc.

Innovation never ends - and in this respect we shall never cease working on innovations and improvements for your benefit.

With best regards

Managing Director

ELASTIC BELLOWS

ELASTIC Bellows are commonly used for protecting machines and devices against debris and chips. They are also used in many variations for safety at work.

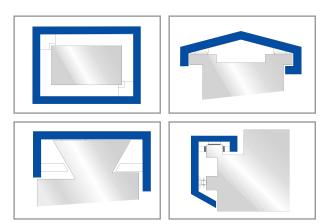

The experience resulting from the production of many thousands of ELASTIC Bellows and their use in working applications has been converted directly into product improvements, new developments, and enhanced product lifetime.

U shape ELASTIC Bellows mounted with metal frame

Constantly growing demands for ever greater machine speeds and ever lower noise emissions are consistently implemented by our engineers.

- Optimal use of space
- Machine size reduced with special materials and space saving designs
- Complete systems bellows integrated in the machine's rear wall covering, complete with guides and mounting devices
- High temperature resistant materials up to 600°C for laser, plasma and welding applications
- Special designs with antistatic surfaces for medical technology and clean room conditions
- Special designs for HSC applications
- Impermeability to coolants

Types

Bellows for elevating platform

Design

ELASTIC Bellows are a series of products with many combinations and options. Their basic components, materials, forms, processing methods, and dimensions are easily adaptable.

For applications such as elevating platforms, bellows can be produced with up to 30 square meters. All ELASTIC Bellows may be deployed horizontally or vertically.

They can be easily attached to the machine with metal frames or Velcro tapes.

Efficient glider profiles and roller or ball bearings improve quiet running and also serve to extend life cycles and minimise friction during HSC applications as well.

SPECIAL BELLOWS

BACKWALL SYSTEMS

GLADIATOR

Roller bearing

During high starting accelerations extension limiters help to reduce the load on the first folds, even out the extension, and stabilise travelling.

Material

Standard materials are black, but also signal colours such as yellow or white materials for medical applications are available.

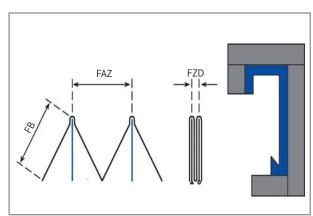

The material is selected from a large range of products to match the intended use of the ELASTIC Bellows.

Also self extinguishing heat resisting materials under the UL 94 standard are available.

Design of ELASTIC Bellows

The essential component of the ELASTIC Bellows is a stabilising PVC frame inside every fold that lends the ELASTIC Bellows high dimensional stability. Reversion to the original shape is therefore assured after direct impacts.

Beside PVC frames PP and Polyamide can be offered as an alternative material for the support frames.

Bellows construction with stabilising PVC frame

ELASTIC bellows are available in the following versions depending on how their frames are permanently joined to the outer fold material:

- thermal bonded version
- HF welded version
- sewn version

Thermal bonded version

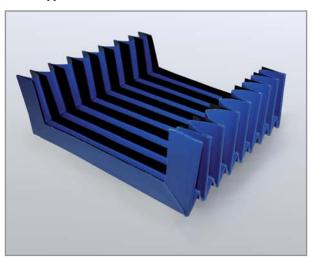

Under the action of heat and a specially developed flux permanent bonding is achieved between the inner PVC frame and the outer fold material.

Thermal bonded ELASTIC Bellows are maintenance free, water and dust proof as well as oil resistant and, to a certain extent, acid resistant.

HF welded version

This type is used particularly for the production of large, shutter type ELASTIC Bellows.

High frequency welding is used to join the PVC frames with the outer bellow material for a perfect shape and a regular overall appearance.

U shape Bellows with stabilising PVC frame

Sewn version

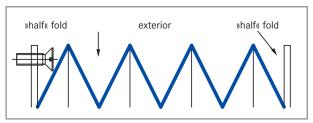

The sewn version consists primarily of high temperature materials. Strong fabrics therefore assure a long lasting solution even under extreme loads.

Mounting

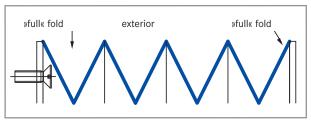

ELASTIC Bellows can be easily mounted on machines and devices with components such as:

- frames of metal or synthetic material attached to both ends and designed to customer specifications
- Velcro tape, easy and fast, maintenance friendly
- clip fasteners combined with metal frames

> PIRAL SPRINGS

STANDARD BELLOWS

LAMINAT BELLOWS

LAMINAT Bellows are characterized by several layers of foil bonded together. The LAMINAT bellows are used where flexible designs and inherent rigidity are important.

LAMINAT Bellows with octagon section and strap retainer

Application

LAMINAT Bellows are nowadays deployed in spindle-type lifting gear, for cameras, measuring and music instruments as well as for medicine and food technologies. They are used to protect columns, spindles and shafts.

All LAMINAT Bellows can be used vertically or horizontally, including hybrid forms. They allow smooth and very quiet running properties.

The surface structure and the regularity of contours present an appealing overall appearance.

Perfect surface of LAMINAT Bellows for medical devices

LAMINAT Bellows are not suited to applications with high temperatures and humidity. If these criteria should be relevant, models from our other lines may be considered, such as Rubber Disk Bellows or Fabric Bellows (see Special Bellows section).

Material

LAMINAT Bellows can be adapted through the choice of basic components, materials, shape, colours, and dimensions. The basic design concept of the LAMINAT Bellows is based on a two-component material.

A manufacturing technique developed to perfection combines the outer material requested by the customer with the appropriate interior material selected by the HEMA designer. For additional stability PVC or metal frames can be added.

Maintenance

A further benefit of these bellows comes in the form of their segmented design. Damaged parts of the LAMINAT Bellows can be easily replaced, reducing significantly the costs for maintenance.

Design

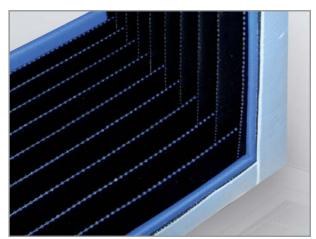

Like the ELASTIC Bellows LAMINAT Bellows can also be designed and produced in a variety of forms.

LAMINAT Bellows are primarily used to cover and protect columns and spindles. Rectangular, hexagonal, octagonal and twelve-sided sections are available as well as roof and inclined shapes and Venetian blind style standards.

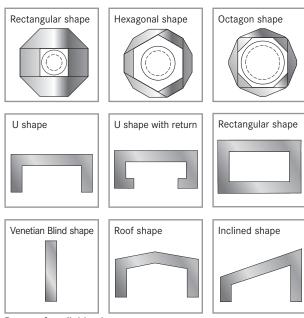

LAMINAT Bellows with intermediate frames

LAMINAT BELLOWS

LAMINAT Bellows, view of interior

LAMINAT Bellows are available as split designs as well. The split type facilitates bellow replacement and maintenance, and so is perfect as a retrofit on machines. The bellows can afterwards be closed with adhesive tape, Velcro tape or bonding. The higher compression of these types must be taken into consideration.

Range of available shapes

Polygonal section with support elements

This sectional view shows an example of a design solution for horizontal applications.

Sub frames with guides or guide rings are used here to support the shaft or spindle.

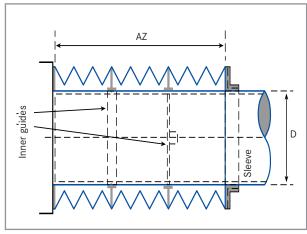

These additional guiding elements ensure that the LAMINAT bellows run smoothly and with less friction

Split version for fast mounting or retrofitting

Characteristic

The stiffness of LAMINAT Bellows (standard designs) can be enhanced with an optional PVC frame or wire hoop in every second or third fold.

Sectional view of bellows with support elements

Furthermore they can be supported on special gliders or roller systems, recommend at speeds higher than 30 m/min. On the polygon sections, spacers and circular guide/support systems ensure the optimum gliding efficiency on columns, spindles and shafts.

Also extension limiters assure consistent extension after high acceleration impacts.

Mounting

LAMINAT Bellows can be easily mounted with metal end frames, clip fasteners, velcro tapes, or sleeves with strap retainer (for polygonal sections only).

Closed designs require adequate ventilation. We offer optional punching with or without filter.

BELLOWS HIGH FREQUENCY WELDED

The high frequency wedet bellows consist of punched disks weldet inside and outside. High frequency welding achieves particularly good shape stability and high transverse stiffness.

Bellow high frquency welded

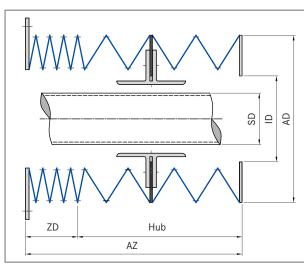

Material

HF welded bellows protect spindles and shafts agains liguids and oils. As standard material TPU 045/080 is used.

Mounting position

HF bellows can be used horizontally or vertically. Additional support and guide rings made of synthetics assure a uniform distance from the spindle and so increase operating life. When with large extensions the stability of the bellows can be increased when a wire ring is installed in every fold.

The usual connecting and mounting elements are metal frames, but sleeves are an alternative.

STEEL COVERS

SKSTEMS 46

PIRAL SPRING

STANDARD BELLOWS

CIRCULAR-STITCHED BELLOWS

The circular-stitched bellows consist of punched disks stitched inside and outside.

Stitching achieves particularly good shape stability and high transverse stiffness.

Circular stitched bellows

Material

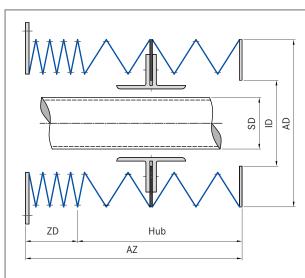

Standard applications require material GN 807, and high temperature applications aluminium/glass fibre.

Circular-stitched bellows are extremely resistant and can even withstand impact from sharp edged chips, also in the smaller versions. They are suitable only to a limited extent as protection against liquids and oils.

Mounting position

Circular-stitched bellows can be used horizontally or vertically. Additional support and guide rings made of synthetics assure a uniform distance from the spindle and so increase operating life.

When with large extensions the stability of the bellows can be increased when a wire ring is installed in every fold.

Sectional view: Circular stitched bellows

The usual connecting and mounting elements are metal frames, but sleeves are an alternative.

Design information

The correct bellow diameter should be about 10 mm larger than the part they are to protect. Use the following formula for measurements.

JET CUTTING MACHINES AND LINEAR GUIDES

Bellows for jet cutting machines

Modern jet cutting machines (with lasers, plasma or water) are fitted with bellows to protect the jet channel and the mechanical components such as spindles and guides.

Guided bellows for laser cutting

These types of bellows require a high level of tightness and long life. Bellows for jet cutting machines are primarily made of self extinguishing materials such as Preotex. The materials selected have been extensively tested with various impact cycles.

At all stages from production to packaging and shipment our bellows are maintained in a particularly clean state and free of dust, e.g. with special packing.

- High temperature resistance of bellow material
- No outgassing of materials
- Gas-tight for minimised flushing gas losses
- Superior clean state during production and shipment

Construction

For better stability the bellows used for jet cutting machines are fitted with stabilizing synthetic material frames.

These frames are customized to each guidance type, e. g. guiding bars. Normally these bellows are mounted with metal end frames.

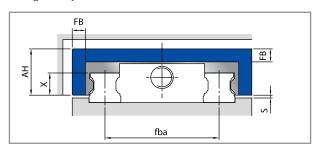

Especially important is a separate guiding system that keeps the bellows material intact.

Bellows for linear guides

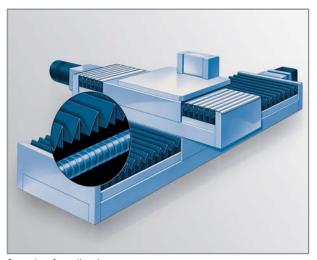

Linear drives can be either retrofitted by the customer or fitted with bellows before they leave the factory. HEMA has specialised in this field and offers bellows tailored to the leading international manufacturers, e.g. INA, NSK, Schneeberger, Bosch-Rexroth, THK or NSK. On the basis of precise type denominations the bellows and their guiding components can be manufactured correctly to size.

Material

Standard applications require PU coated materials, but heat resistant and self extinguishing materials are also available. For the best services and immediate replacements these bellows are also available as <code>**endless* versions*(** with 200 or more folds in total. The required dimensions can easily be configured by the customer.</code>

SAMURAI BELLOWS

SAMURAI Bellows are an advancement of the ELASTIC Bellows product line. Characteristic for this type of bellows are their lamellas.

The lamellas are fixed at the upper edge of the bellows, which also reinforces them. They provide excellent protection against fast, very hot and sharp chips.

SAMURAI Bellow

SAMURAI Bellows are ideal for HSC applications. Solutions for machining centres with speeds greater than 100 m/min and accelerations greater than 2 g have been successful realized.

| Type of bellow | heavy swarf impact | X/Y axis | Z axis | less space |
|-----------------------|-----------------------|-------------|-----------|---------------|
| ELASTIC | | | | |
| FASTAF | | | | |
| FASTAM | | | | |
| FASTAC | • | | | |
| Vector C ² | • | | | |
| FASTLAP | | | | |

Design

Similar the ELASTIC range of products, all materials, shapes, processing methods, and measurements for the SAMURAI Bellows can be combined in any variation. Also a PVC frame is built into each fold of this bellow for assured stability.

Lamellas

The position of each lamella can be individually chosen. The lamellas can be fixed to the front of the bellows, each side, or in any combination.

In addition, our in house production of lamellas means we can provide them in nearly all forms, such as inclined or roof types. Stainless steel is used for the material.

Excellent closing and sealing on the top side

Usually the basic lamella type is flat with its end formed into a wiper profile, for excellent contact and sealing on the top side of the SAMURAI Bellow.

There is a high contact pressure across the whole lamella area. With their efficient wiper edge the lamellas prevent debris from entering the interior.

Example SAMURAI Bellows type Vector C²; a ready to install solution including interlocking system for loading through the roof. Combination with optional mechatronics system »CoverShutter« possible.

DURASPRING

Application of lamella bellows

When in use the lamellas develop a regular formation of stripes on their surfaces. This is normal and caused by their edges and has no effect on their functionality or service life.

The lamellas are corrosion and acid proof, but not accessible.

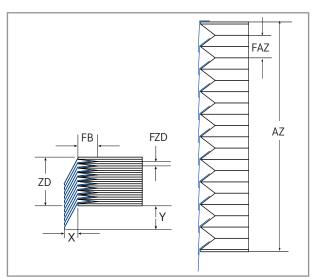

SAMURAI Bellows are available in three basic types. These main types are based on how the lamellas are fixed:

- FASTAF fixed lamellas
- FASTAC fixed telescopic lamellas
- FASTAM flexible lamellas
- FASTAF Vector C² special type for multi axis protection

SAMURAI FASTAM

Please note: If the guiding runs between bellow and lamellas, the given dimensions for Y (vertical space) will be reduced by $15\ \mathrm{mm}$.

FASTAF 2-folds (one sheet of lamella protects two folds)

SAMURAI BELLOWS

FASTAF

FASTAF types are SAMURAI Bellows with fixed lamellas. Owing to this design the lamellas overlap. The lamellas are hinged or clipped. When damaged they can be replaced.

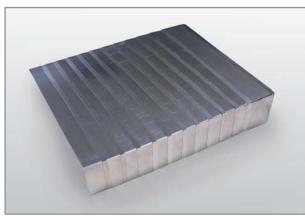

SAMURAI FASTAF, demonstration of »overlapping«

FASTAC

FASTAC types are SAMURAI Bellows with fixed telescopic lamellas (boxes).

The lamellas cover the front and also the side parts of the bellows, forming an enclosed surface. These <code>%closed(*FASTAC)</code> lamella bellows are primarily used in a vertical operating position as an alternative to telescopic steel covers.

SAMURAI FASTAC

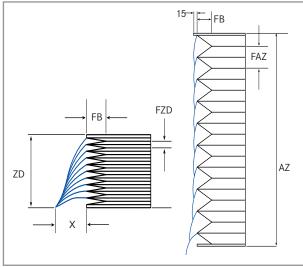

FASTAM

SAMURAI Bellows of the FASTAM type are equipped with flexible fixed lamellas, so lamella projection must be taken into consideration. The lamellas "stack" when the cover is compressed.

The lamellas are hinged or clipped. When damaged they can be replaced. $\,$

SAMURAI BELLOWS

VECTOR C² type

The FASTAF type VECTOR C^2 is a special type for machining centres where continuous covering of the working space (e.g. rear wall, upper roof area) is required.

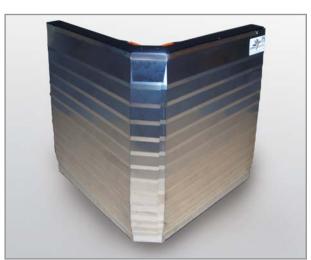

SAMURAI Vector C2, interior angle

With its unique design of fixed mounted lamellas only one bellow unit is needed to cover the corner areas.

The space allocated to the covering can be used very efficiently, and machining dust is significantly reduced.

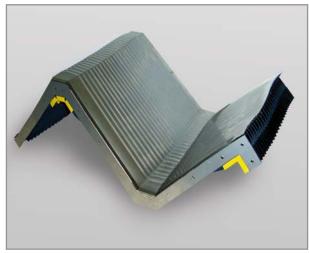

For swarf protection the VECTOR C^2 type is equipped with two overlapping, bended metal sheets mounted securely on each fold.

SAMURAI Vector C2, exterior angle

The VECTOR C^2 corner lamella is available as a bended or rounded version providing both a stable structure and reliable functionality.

Even at high operating speeds and accelerations this stable and reliable concept responds flexibly to all interior and exterior angles and combinations of angles.

SAMURAI Vector C², combination of interior and exterior angle

The lamellas for this type of SAMURAI Bellows are available in four shapes:

- Outside
- Inside
- Inside round
- Inside Outside

SAMURAI FASTAF TW for limited space

The SAMURAI FASTAF TW has been developed as an alternative to the classic design of protective covers.

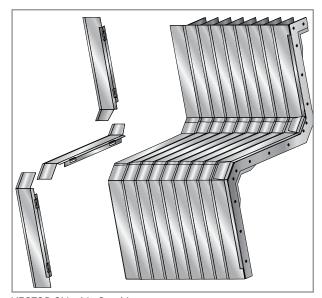

This lamella cover "bends around the corner" and is therefore perfectly suited to machines with limited space below the cover.

The compressed cover is turned through 90° allowing more design opportunities. The preload of the lamella's in the area of the radius is maintained through innovative design.

URASPRING

SAMURAI FASTLAP lamella aprons are a variation of the SAMURAI bellows. They were designed for \boldsymbol{Z} axis covers in machining centres.

The substructure does not consist of ELASTIC bellows but only a carrier material to which the lamellas are fixed.

SAMURAI lamella apron

FASTLAP Lamella apron

FASTLAP

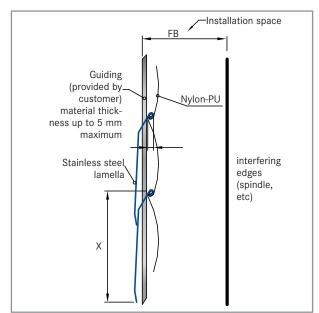

The lamellas are made of stainless steel of 0.5 mm thickness up to a maximum width of 4,000 mm, and mounting is simple. The compression per fold is about 4 mm.

The lamella apron requires a guide on both sides that must allow for a side length of 25 mm.

The lamella apron is secured to a tear-proof Nylon-PU material selected specifically for each application.

SPECIAL BELLOWS

SOFT PVC BELLOWS

Soft PVC Bellows occupy a special position among the different types of bellows. ELASTIC Bellows (see Chapter ELASTIC Bellows) offer extremely flexible design options with regard to material, dimensions and shape and can nevertheless also be produced economically in very small quantities.

Soft PVC Bellows in standard colour black

Soft PVC Bellows on the other hand are moulded parts, i. e. a certain minimum quantity or corresponding tooling must be available to justify economic production.

Correspondingly, cost reduction can be achieved with larger quantities which makes these parts particularly well suited for large series use.

Tooling is already available for many configurations, therefore attractive prices can be offered even for smaller quantities. The dimensions and shapes shown in the catalogue are available as standard forms. In addition we would be pleased to assist you in the design of special types.

Large variety of forms and colours

Split version

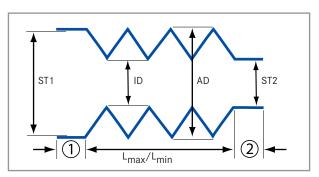

Material

We use a special PVC as standard material. The bellows are resistant to alkalis and acids; they are water and dust-proof. The standard colour of these bellows is black, but other colours as well as a version in transparent material are also possible.

Temperature

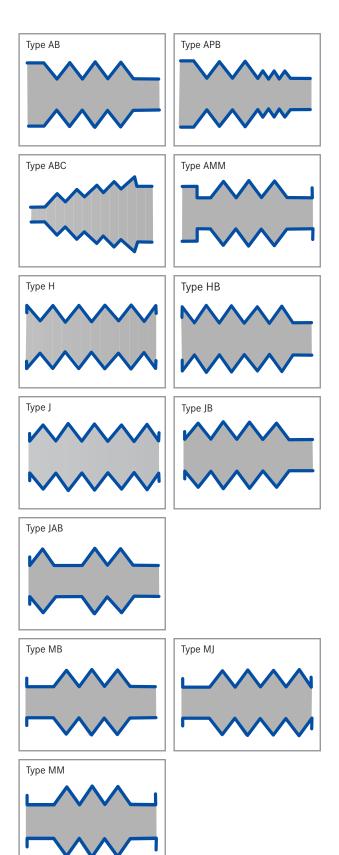

Legend

The operating temperature range is between -20°C and +80°C. For a short time a maximum operating temperature up to +120°C is possible.

SPECIAL BELLOWS

RUBBER DISK BELLOWS

the most les. They

Rubber disk bellows are of the highest quality and visually the most attractive protective covers for pistons and spindles. They are completely leak proof. Since each rubber disk lies flat on the other, excellent compression dimensions are achieved.

The production of rubber parts depends directly upon the control and monitoring of the production processes. Each process step, from mixing up to rolling out the material, from punching the disks up to the vulcanization process, is performed under the most accurate observation and attention. Stringent quality criteria leads to high process reliability. After vulcanizing, the rubber disk bellows are ground on the outside, so that they have an absolutely smooth surface when closed.

Good resistance to light and atmospheric conditions and are well suited to outside use. If emphasis is on oil or coolant protection in your area of application, then we recommend the use of NBR rubber foil. Alternative materials are available for high temperature requirements.

Compression of Rubber disk bellow

Types

For standard types of this bellow round profiles will be used. As an alternative, square, rectangular or oval profiles can also be produced.

Dimensions

Rubber disk bellows are supplied in standard sizes with inside diameters of 20 to 400 mm and outside diameters of 40 to 480 mm.

Rubber disk bellow

We supply the bellows in 5 mm graduation up to a diameter of 200 mm and in 10 mm graduation above this.

The extended length of the rubber disk bellows can be up to 10 metres.

Mounting

Rubber disk bellows are fastened the same as other bellow types with sleeve or metal flange.

Design

With large extension length and horizontal installation, it is usually necessary to use additional guide elements. In the most simple case, the bellows are stabilized by internal wire rings

In more complex applications, guiding systems with rods or cables can be incorporated internally externally to the bellows.

When mounting these bellows please pay attention to sufficient aeration.

Construction

| Calculation | n formulae | |
|------------------|------------------------|--|
| L _{max} | FZ x FB | |
| L _{min} | FZ x 2,5 | |
| FB | (AD - ID) 2 | |
| FZ | L _{max} FB | |
| FZ | Hub (FB - 2.5) | |

FABRIC BELLOWS

If bellows are subject to especially heavy wear, high pressure conditions or high temperatures up to 200°C, fabric bellows can be used.

Fabric bellow coated with synthetic material

Typical fields of application are piston rods with high ambient temperatures, or cardan shafts. Fabric bellows consist of a laminted structure, whereby the supporting fabric is coated with a synthetic material.

In contrast to the rubber disk bellows, the fabric bellows have a structural reinforcement which withstands the mechanical forces acting. The external protective effect of the rubber is maintained completely.

Nevertheless, the supporting fabric changes the character of the surface, so that the smoothness of the rubber disk type is lost.

Fabric bellow coated with Alu/Glass fibre coating

Material

Fabric bellows are delivered as standard in CR rubber coated fabric. All materials can be laminated with Teflon foil. A speciality are fabric bellows made from leather and carbon fibre with Aramid or Alu/Glass fibre.

Types

The fabric bellows will be normally produced in round shapes. As an alternative, square, rectangular or oval profiles can also be produced.

The bellows are fastened like the rubber disk bellows.

Construction

Calulation formulae (material with 1 mm thickness)

Lmax = FZ x FB x 1.4 Lmin = FZ x 6 FB = $\frac{\text{(AD - ID)}}{2}$

 $FZ = L_{max} : FB : FZ$

BACKWALL SYSTEMS

COVERS FOR MOVING COLUMN MACHINES

These machines with their large travel and working space areas require a special solution.

For the workspace area, both backwall systems and large bellows with or without lamellas are suitable.

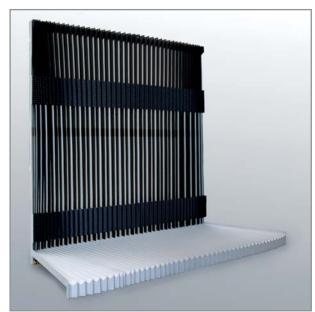

Typical backwall cover

Depending on the machine type and its concept two design principles are applicable:

- Column type cover
- Venetian blind type

Column type cover

This design principle is used if a guiding rail is not possible. The column milling cover type is L-shaped and runs on gliders.

Cover for column miller used for medical applications

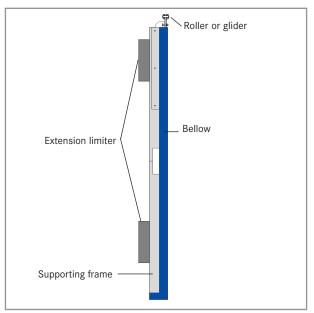

Venetian blind type

If a guiding frame is available, the bellow can be supported using profiles, roller or rail systems.

The guiding system has been successfully tested on a high speed test machine at the PTW under worst conditions. Over one million cycles were recorded.

Venetian blind type cover with SAMURAI Bellows for moving column machine

Design of venetian blind cover

CUBE BACKWALL SYSTEMS

Milling machine centres are fitted with complete backwall systems.

The design of an individual solution is time and cost intensive, and these can be reduced only if larger piece numbers are produced.

A modular built-up rear wall system can reduce the engineering efforts even for a single backwall - and the CUBE Backwall system was developed.

- Suitable for protection systems for two axes
- Significant reduction of engineering time
- Fast and detailed information for machine engineering
- The costs for each CUBE rear wall system are well below the costs of an individually designed concept

CUBE Backwall system

These features benefit machine builders with smaller production numbers and special machines.

The great savings in time and money compared with previous construction requests and orders could otherwise only be managed with large production numbers of identical design.

Design

Using the straightforward formulas we can determine the width and the height of the outside frame of the cover and for the sheet metal design and then provide these for the machine construction. The covers in the CUBE model consist of bellows which are incorporated along the X and Y axis fitted individually for the perfect match. Depending on the loads and machine travel speeds we select suitable bellow guiding:

- CUBE 60: standard profiled glider guide for speeds up to 60 m/min
- CUBE 80: Backwall system with rail glider guide for speeds up to 80 m/min
- CUBE 80+: High load roller rail guide for speeds over 80 m/min
- CUBE X: Customized solutions

For backwall protection SAMURAI Bellows are used. Fixed mounted stainless steel lamellas protect the bellows against hot and sharp edged swarf.

Through spindle

The spindle opening is designed to the customer's requirements.

The frame construction is made of solid warp resistant steel sheet. The mounting options for the rear wall can be integrated in the frame construction, but the force transmission along the X axis requires connections to the machine in the upper and lower areas.

For an optimum load transmission to the X axis cover protection, this cover must be connected at the top and bottom with the moving column or other supporting machine parts.

Versions of CUBE X with large extensions up to five meters long and three meters high have already been realized.

Additional concepts such as DynaSynchro or pantographs can absorb the dynamic loads. Therefore a travelling speed up to 120 m/min can be realized.

Allgemeinfaktor Y-Achse

ZDFaktor_v 0.075

Basic principle for calculation

These data also cover extreme situations. If less space is available in the customer's machine construction, the data are adapted accordingly.

Calculation example

Example calculation for CUBE 80+

 V_X 80 m/min V_y 80 m/min Hub_X 800 mm Hub_y 650 mm F_X 200 mm F_Y 200 mm

Calculation of the compression

 $ZD_X = Hub_X \times ZD_{Factor80+} = 800 \text{ mm} \times 0.165 = [132 \text{ mm}]$ $ZD_Y = Hub_Y \times ZDFY = 650 \text{ mm} \times 0.075 = [49 \text{ mm}]$ [] = values rounded up without decimal place

Calculation the results for CUBE₈₀₊

Outside frame width in X direction:

AB = (System spec. value*) + Hub_X + F_X + 2 × ZD_X

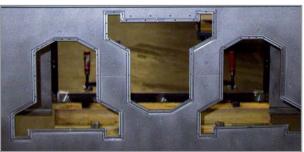

AB = $(97 + 75 + 75 + 97) + 800 + 200 + 2 \times 132 = 1.608 \text{ mm}$

Outside frame heigth in Y direction

AH = (System spec. value*) + U_{80} + Hub_y + F_y + 2 × ZD_y AH = (104 + 72 + 72) + 137 + 650 + 200 + 2 × 49 = 1.333 mm

X-Velo Roof cover

Machine tools without roof covers may pollute the environment by spraying out cooling lubricant and swarf. The air in the environment is also contaminated by the vapours that result from the machining process.

X-Velo Dachabdeckung

The X-Velo Roof Cover System prevents the machine's interior from discharging material into the atmosphere. Thanks to our adapted aluminium profile guide rails, the roof cover can be installed easily on new or existing machinery. The machine is sealed off and covered effectively as a result of X-Velo's construction features.

The folds are 250 mm in height, and close almost flush with the cover so that no dirt can get out. If individual swarf particles settle on the X-Velo, the open profile of the X-Velo enables the folds to be cleaned easily. Despite the fact that it is covered, the machining room stays well-lit as the material we use for the folds is translucent.

The X-Velo Roof Cover System can be adapted to almost any area as it is a modular system. It can be manufactured in widths of up to 6 m and lengths of up to 12 m.

This length can also be extended, dependent on inspection of the specific area it will be implemented in. The X-Velo is designed for high speeds of up to 75 m per minute. It is impossible for it to get twisted during operation because of the fasteners that are used in it. If you so wish, the X-Velo can be provided with or without a motor, or with metal shutters or rubber-coated shutters, depending on the type you select.

The X-Velo Roof Cover at a glance:

- Custom length, up to 12 m, custom solutions can be discussed
- High speeds of up to 75 m/minute
- Material lets in light
- No twisting thanks to our special fasteners
- Easy to clean (open profile)
- Cover is easy to screw on, screw thread goes all the way through the profile
- Guide rails are included with delivery
- A motor drive can be integrated as an option
- Shutters that fit the drive perfectly
- Ideal for retrofitting and original fitting

PURASPRING

PROJECT TEAM

The design and realisation of large protection systems and complete backwall systems is supervised by an experienced team during all stages of manufacture.

Engineering and design

All important details of the machine for the design of new protection systems are integrated in the engineering stages. Every cover is individually designed to meet the specific requirements and to fit perfectly for each machine tool.

Production of components

All components are produced with modern machines. Sheet metal components are accurately cut to fit by laser. Other parts of the covers, such as pantographs or gliders for smooth running, are chosen individually depending on the area of application and travelling speed.

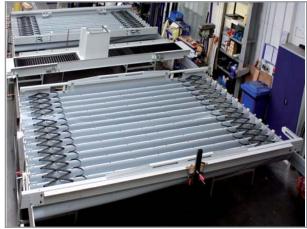

During each production step all parts and materials are regularly checked for accurate dimensions and proper functioning. Visible surfaces are polished to a special finish.

Test set up

Before shipping all parts are checked for accurate visual appearance and perfect functionality.

Assembling

Roof cover with a length of more than nine meters, and a selfsupporting width of more than five meters

Backwall system for XY-axis

Shipment

To be as cost efficient as possible all parts are shipped in compact and protective packaging. Customers' internal processes are given special consideration.

GLADIATOR STEEL COVERS

ASTEMS 46

RAL SPRINGS

E GLADIATOR

GLADIATOR TELESCOPIC STEEL COVERS

Telescopic steel covers are used to protect slideways in certain machine tool applications. They offer effective protection against swarf and other debris.

Liquid or coolant ingress can be effectively reduced by feature design and the use of suitable wiper systems.

The benefits:

- Cost efficient production
- Efficient wiper systems
- High quality production
- Repair service and spare parts ex stock
- Fast design and delivery times

Design

- The depth of one individual box section should not be larger than 750 mm
- The cover height should not be larger than the length of the cover because of the danger of it falling over.
- The relation of box depth to box width should not exceed 1:6
- Principally use only graded types where each wiper rests on the adjacent box section. Designs where wiper overhang can result in swarf ingress.
- With coolant, the top of the covers should be inclined at an angle of 5°
- In principal, allow space for an underside return of the box sections, as this will stiffen the structure and will provide a constant pretension
- The minimum distance of the smallest box to the guiding position should be 12 mm
- For calculating the travel of the cover, add 5 mm of reserve per box to the travel of the machine
- For covers used in vertical position, gliders should be used for the underside return, which should be screwed on at least to one side for later (dis)mounting
- As a general rule is: maximum extension and minimum compression should be at maximum in the ratio 10:1

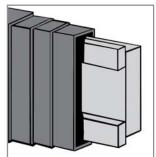

Material

The steel covers are produced from high quality cold-worked sheet steel in material thickness from 1.5 to 3 mm, or if required in stainless steel.

For all common types of machines a suitable type of cover (e.g. horizontal, vertical, inclined; transversed) together with the corresponding guide way solutions is available.

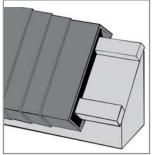

Samples of cover type

Horizontal

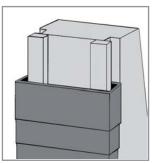

Transversed

Inclined

Inclined, folded

Vertical

Impermeability of telescopic steel covers to coolant

Due to the design of steel covers a complete sealing against fluids cannot be guaranteed.

The standard types generally provide sufficient coolant protection. For high coolant flow rates, additional internal drainage channels, or a thermally bonded ELASTIC bellow underneath can offer additional protection.

GLADIATOR COMPONENTS

Telescopic Steel Covers can be custom built to suit any application by adding further individual components.

Wiper profiles

For Telescopic Steel Covers different wiper systems are available. In addition to standard wipers also wiper systems with replaceable lips or additional lip protection are available.

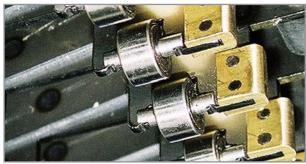

All systems come with optimised wiper profiles and differing degree of hardness for dry and wet machining. For more detailed information of these systems please see the following pages.

Wiper

Support and guideway gliders

Telescopic Steel Covers up to a weight of approx. 50 kg can be supported by guideway gliders. Special profiled brass parts with sufficient contact width (appr. 5 mm) suitable for hardened and soft guideways, or with PUR inserts.

Supporting rollers with lateral brass guides

Supporting rollers

For covers greater than 50 kg unloaded weight supporting rollers are recommended. Hardened guideways (>58 HRC) or separate support/guideways are required, no matter how large the total number of rollers, assume that the total weight is supported on no more than for rollers.

Walk-on area

As an option a chequered plate to walk on can be added to the largest box section for easier maintenance of the machine.

Walk on area on largest box

Access window

By building in access windows (an option) into the largest box, the maintenance and repair of the machine parts underneath can be achieved without having to remove the complete cover.

Pantograph systems

For high speed of more than 30m/min we build in pantograph systems (graded versions as well). The space required will be increased in this case.

Telescopic steel cover with pantograph

Glider and damper systems

Glider and damper systems reduce impact, noise and friction. Optionally, wipers with dampers can be used as well.

Mounting

For mounting/dismounting and transport, suitable lifting lugs can be fitted.

DURASPRING

GLADIATOR Telescopic steel cover

GLADIATOR Telescopic steel covers are individually designed for each machine to meet special requirements.

For special requirements, covers greater than 5 metres width and expansion more than than 15 metres can be realized

All parts of this construction are individually designed and checked for smooth operation.

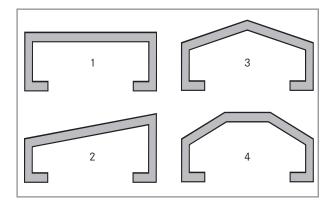

GLADIATOR DESIGNS

Designs

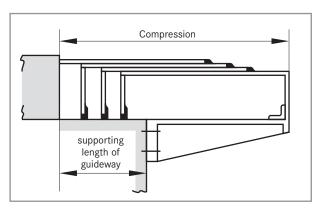

Telescopic steel covers can be produced in different designs:

- Standard design (1): cost-efficient, suitable for most standard applications. It can be used without problem up to a width of 900 mm
- Inclined shape (2): provides optimal drainage of liquids
- Roof shape with single edges (3): for larger widths, additional returns are required to increase the cover stiffness. Provides optimal drainage of coolants.
- Roof shape with double edges (4): for larger widths, additional returns to increase the cover stiffness, optimal drainage of fluids.

If the compression exceeds the available supporting length, a support box section has to be added.

For the opposite case, the largest front box section may be extended by a plate. The problem here is that chips and dirt may accumulate impairing the functioning of the cover.

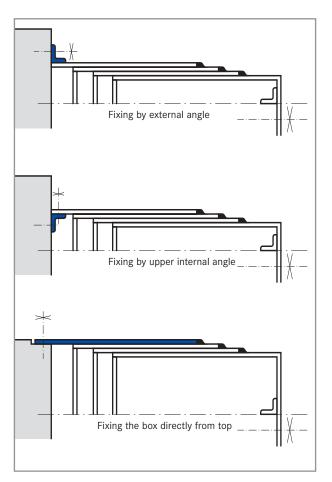

Pay attention to a smooth transition from the guideway to the machine bed extension.

Extensions are required only in the area of the support gliders. They can be manufactured from common steel (i.e. St37K).

Mounting

For mounting and fixing of the steel covers we offer you solutions specifically to the customer's individual requirement. The covers are fixed either directly to the corresponding first or final box section or by additional fixing brackets which may be attached internally or externally.

- Fixing by lateral external angle (recommended)
- Fixing by upper internal angle.
- Fixing the box directly from the top high positional accuracy is required.

Transport

The covers are transported in the closed position; additionally they should be stored in an environment without humidity.

Before shipping, the telescopic steel covers are sprayed with an anti-corrosion oil and wrapped into plastic foil.

This will protect the steel cover against corrosion during transport and longer storage periods.

Please lubricate the entire steel cover from the outside before operation.

MAINTENANCE AND CARE

GLADIATOR Telescopic steel covers require regular maintenance during use. To avoid damage, they should be inspected and cleaned regularly, depending on the degree of contamination.

GLADIATOR Telescopic steel cover, sample

Surface of the steel covers

Please extend the steel covers and clean off any dirt. Next you should rub the steel cover with an oil-soaked cloth. This will prevent early wear and corrosion.

GLADIATOR Telescopic steel cover, extended

Do not clean by compressed air, because foreign particles may be forced into the interior of the steel cover.

Steel covers and chip exposure

When heavily exposed to chip, the steel cover should be checked frequently and regularly for ingress of swarf.

If swarf is found on the inside, the steel cover should be disassembled and cleaned carefully.

Chips located in between the boxes will cause rapid deterioration of the steel cover.

Maintenance

Regular preventive maintenance is the basis for long-term and reliable operation.

Please ensure that the following wearing parts are exchanged at regular intervals, depending on wear:

- Guideways
- Wipers
- Gliders and rollers
- Pantographs
- Seals

Guideways

To inspect the guideways of the machine, compress the steel cover and disconnect at the largest box.

Take this opportunity to spray the underside of the cover with oil.

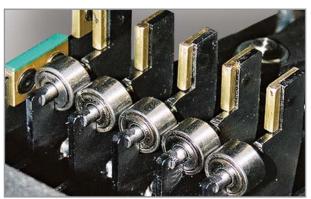

Wipers

Wipers and their lips should be inspected frequently and regularly. Please renew the wipers and lips if the adjoining box sections are no longer in proper contact.

This can be recognised by smear formation or remaining deposits of coolant and chips.

Gliders

Please renew the gliders when their bearing surfaces show heavy wear or deformation or when chips have penetrated.

Roller and glider

Seals

Regularly check joints which had been treated with sealant. Should these seals detach or dissolve, e.g. by aggressive coolants, they have to be replased with appropriate sealant (e.g. PU or silicon).

Safety information

Please consider the safety information in the service and maintenance manual included with each delivery.

WIPERS FOR TELESCOPIC STEEL COVERS

The wiper systems for steel covers can be sub-divided into three main groups:

- Types P 01/P 02/P03 wiper lip cannot be replaced
- Types DSP/DV/LP wiple lip can be replaced
- Types LV wiper system can be replaced. Replacing of wiper lip without dismantling of cover

Wiper type P 01/P 02/P03

Wiper of types P 01/P 02 can be used universally. They can be used horizontally for telescopic steel covers or vertically for guideway wipers. A polyurethane wiper lip is vulcanised onto one or two steel profiles and thus permanently bonded. An additional support by steel frame is available as an option. When worn, the complete wiper must be replaced. These wipers lips are available in lengths of 500 mm.

Wiper Type DSP/DV/LP

Wiper lips of these types can be replaced when worn. The service should be done by professional service personnel. They are fixed by spot welding. These wipers are compatible with many systems common in the marketplace. The metal profiles are produced from stainless steel.

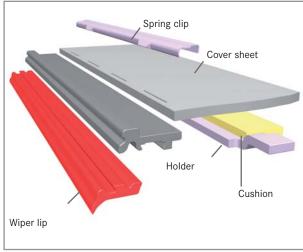

Wiper lips are available in lengths from 1,000 to 10,000 mm, metal profiles from 1,000 to 3,000 mm length. Wiper lips and metal profiles can be ordered separately.

Wiper Type LV

This innovative system enables a significant reduction of maintenance time and costs. The wiper lips of type LV can easily be changed when worn. Replacement can be made by customers own personnel. For replacement of the wiper lip, only the spring clips have to be loosened, and the profile with wiper removed and replaced.

There is no further dismantling of the cover required.

In comparison to standard wiper systems, machine down time can be reduced by up to 15%.

LV Wiper System

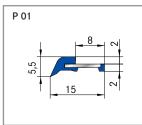

Wiper lips are available in lengths from 1,000 to 10,000 mm, metal profiles from 1,000 to 3,000 mm.

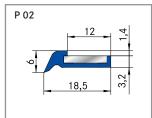

Material of wiper lips

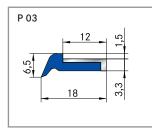

The wiper lips are manufactured from high-grade polyurethane and offer good mechanical and chemical properties.

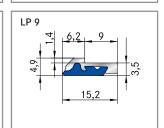

They are temperature resistant up to a maximum of 130°C (natural rubber up to 135°C), continuously up to 90°C (natural rubber up to 100°C).

WIPERS FOR GUIDEWAYS

The guideways of machine tools must be kept free of chips and debris. Therefore wipers are important.

Wipers for guideways are designed specifically to occupy minimum space.

These wipers can be produced in different forms, dimensions, and in different materials. For each application there will be an optimal version available.

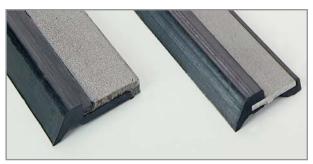

For guideway wipers there are four different types available:

- Wiper Type P
- Wiper Type L
- Wiper Type S for welded wiper
- Individual designed, vulcanised wiper

Wiper type P

Wipers of this type can be used universally. They can be mounted horizontally for Telescopic Steel Covers or vertically for guideways.

A polyurethane lip with a steel core is vulcanised to a steel profile. An additional steel band reinforcement is available as an option.

Wiper type P

Wiper type L

This wiper type is produced as an insert with a lip of natural rubber. This lip possess's excellent mechanical qualities and a high resistance to abrasion.

The material is resistant to mineral oils, coolants, and microorganisms.

Wiper type DSP/DSV

Wiper type S

These wipers are equipped with a special two-sided lip, providing rear sealing to coolant.

Its outer support of nickel chromium steel offers high rigidity and stability under load.

Wiper type S with additional metal wiper

Individual wiper

Vulcanised wiper systems are available according to customer's drawing. They can be produced in many forms. For economic production a minimum of 20 pieces must be ordered.

Individually designed type with vulcanised wiper lip

Design

Standard wipers are available in the following lengths:

- Wiper Type P: 500 mm
- Wiper Type L: 500 mm
- Wiper Type S: 530 and 1,000 mm

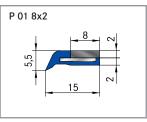

Wipers according to customer's specification can be produced. Additionally they can be equipped with an extra steel wiper. Preload of wiper is generally 1 mm.

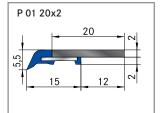

Material wiper

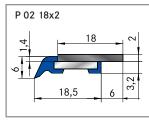

- Polyurethane
- Temporary temperature resistant up to 130°C
- Permanent temperature resistant up to 90°C
- Resistant to mineral oils and coolants
- Excellent resistance to absorbtion
- High resistance to micro-organism's

ROLLER Covers

ROLLER cover systems are a possible substitute for bellow covers in very narrow spaces when only general sealing is required.

Two different types are available:

- ROLLER blind without housing this type needs less space, best used with smaller diameters and short extensions
- ROLLER blind with housing we recommend this type for safety reasons when longer extensions are used and especially when steel is used for the band material. They are available in many variants.

ROLLER blind cover without housing

Drives

The ROLLER systems come with different drive concepts:

- Torsion springs TF:
- Steel band drives SA:
- Steel band spring drive FM: Drive separate to cover band
- Electrical drive:
- Drive separate to cover band
- Cover band forms drive
- to customers specifications

(see page 62)

ROLLER blind cover with steel band and housing

Torsion springs TF

Torsions springs are very well suited for a long working life performance at low loads. We recommend torsion spring drives primarily with synthetic material covers.

The torsion springs are manufactured from a high quality alloyed wire. This wire material has been proved to reach ten times the service life of a conventional wire spring.

Steel band drive SA

For higher tension forces we recommend SA steel band drives. The steel band for the outer cover also serves as a spring motor. Steel is selected for the band.

Steel band spring drive FM

Also suitable for higher tension forces are the FM steel band spring drives.

| Design option | ROLLER with TF drive | ROLLER with SA drive | ROLLER with FM drive |

All dimensions in mm.

[#] The band with is depending on the kind of drive FM or TF), a FM drive requests a band width of 50 mm min., a TF type 150 mm min.

^{* 21/28} means a roller diameter of 21 mm for regular load and 28 mm for high load. Other types and sizes on request. Square outer housing, rollo size is equivalent to outer dimension of the tube. Type without housing: first number: standard spring force/second numer: enlarged spring force is required.

non-metallic band possible

ROLLER Covers

Dimensions of housings

The measurements for the ROLLER System housings must take into account the band width, length of extension and also type of drive.

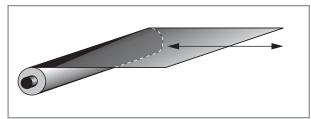

Design data for calculation

For the design of the ROLLER covers the following factors should be considered:

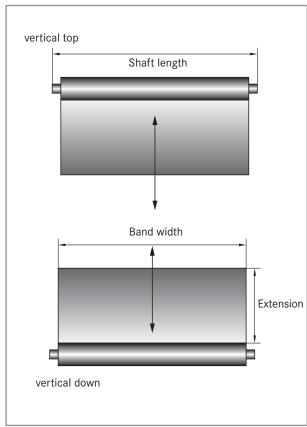

- speed of travel
- intended total number of cycles, working life
- frequency and speed of changes in travel direction
- mounting position, direction of swarf

Operating position

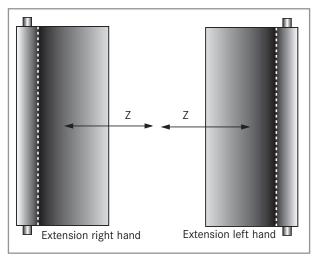

The operating position can be vertical, horizontal or transverse, with an extension to the left, right, top or bottom side.

Operating position: horizontal flat

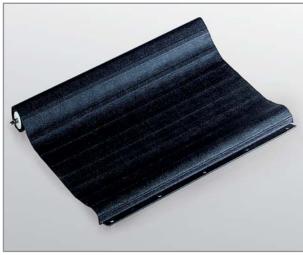

Operating position: vertical flat

Operating position: horizontal upright, e.g. for X axis covers

Pre-loading

- ROLLER systems with housing are pre-loaded at the factory to customer or HEMA specifications and are ready to install.
- ROLLER systems without housing are not pre-loaded.

Roller blind with cover band

Cover material

The outer band is subjected to a wide variety of stresses; the material chosen depends on the field of application:

- Steel bands with rounded edges (standard and stainless steel): Protection from cold and hot chips, coolants. Maximum width of steel band standard 300 mm, steel band stainless 1000 mm
- Synthetic bands, e.g. Preotex, awning cloth, Neoprene, etc.,
 Protection from dust, coolants, contact guard
- Link aprons: Protection from large chips, coolants: Recommended for applications requiring additional lateral stability

Mounting

A variety of mounting positions is available. ROLLER covers with housing can be mounted at the standard positions shown in the next column.

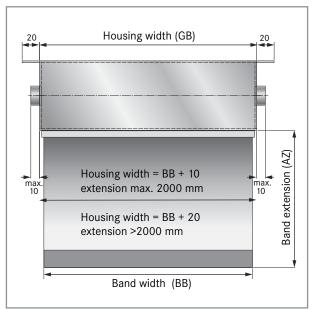

For mounting roller covers without housing two holder types are available for easy and permanent fixing:

- Standard holder (HL)
- Heavy duty holder (HS)

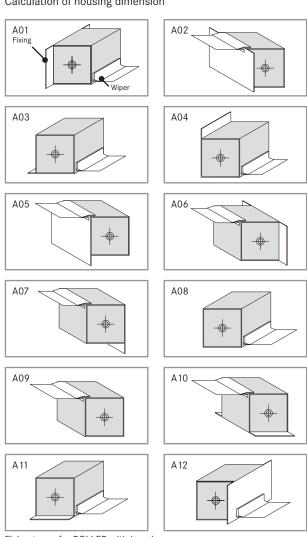

Customized holders can be produced for special requirements.

Please note

ROLLER covers ordered without housing are produced with round shafts as standard.

LINK APRONS

Link aprons are a low-priced type of cover, providing excellent service in front line protection against chips and coolant. In many cases, link aprons serve as a protective hanging curtain or run over a guide roller for especially smooth running. They offer good flexibility, are mounted easily and require little space.

FLEXSTAR Link apron aluminium

FLEXSTAR ALC Aluminium-Profil

Combination with ROLLER system

For more demanding solutions, the link aprons are combined with a system of roller blinds.

The link apron is wound on top of the ROLLER standard system. The ROLLER diameter is considerably increased in its wound-up state. The drive unit is exactly matched to the additional weight and forces. We offer complete guide systems based on travel rails, steel cables or aluminium profiles.

FLEXSTAR Link apron with holder and fixing bracket

HEMA link aprons are subdivided into the basic types:

- FLEXPRO aprons
- FLEXSTAR aprons
- FLEXWALK
- FLEXSTAR Windows

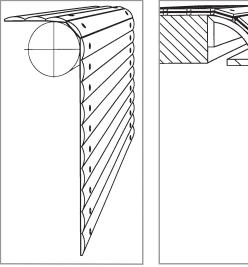

Link aprons

The metal sections are flat or semi-circular aluminium, brass or steel sections. They are bonded and riveted on a very tear resistant synthetic carrier material

The sections have a standard width of 15 or 16 mm, the height of the rods is between 2.0 mm (flat) and 3.0mm (semi-circular). The link aprons are manufactured in a width up to 3000 mm.

FLEXPRO link apron, different combinations

FLEXPRO (Type 4/5)

FLEXPRO (Type 1/2/3)

FLEXSTAR aprons

These aprons are made up of anodised hollow aluminium sections joined with a polyurethane strip. On the visual side the glider elements are rounded at the edges (FLEXSTAR-S) or straight (FLEXSTAR-C/CR).

FLEXSTAR-S

FLEXSTAR-C/CR

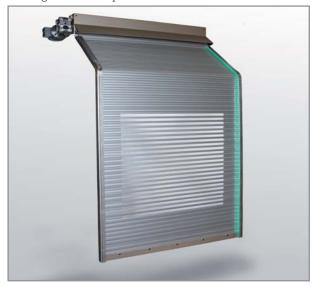

FLEXSTAR ALC14/ALC25

Both extrusion have bending restraints

- FLEXSTAR-S can move freely in both directions
- FLEXSTAR-C/CR permits only one-way bending, adopting a stable flat position in the other direction

Example for a customized solution

For an application in the packaging industry a combination of electric drive, FLEXSTAR apron covers, and steel band was designed as a kind of Faraday cage. A mechanical drive can be integrated as an option.

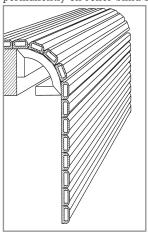

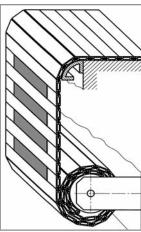

Example of link apron with electric drive

FLEXWALK

The FLEXWALK type is available in two section sizes. It is a combination of extremely stable hollow aluminium sections and a carrier fabric of synthetic or stainless steel band.

This is used when the customer requires an accessible solution. The aprons with a steel band as carrier material are joined with a high-performance bond of the required flexibility. These steel band aprons can therefore be used permanently on roller blind systems as well.

FLEXWALK

FLEXSTAR-Windows

FLEXSTAR Windows

FLEXSTAR aprons combined with vision inserts are very popular on the assembly sectors. We offer different types with rigid polycarbonate inserts or flexible see-through foil

FLEXSTAR Windows with see-through foil

FLEXSTAR Windows with polycarbonate inserts

Material

These link aprons consist of hollow section solutions manufactured to the greatest precision. The gap dimensions between the sections provide the best possible protection for the polyurethane strip. End caps improve the gliding properties. The standard colour of these caps is blue, but other colours are available on request.

LINK APRONS

Mounting

The link aprons can be fastened with

- hollow aluminium section angles
- metal ledges
- metal angles at the end of the apron

Customers are free to choose the shape or fixing hole pattern.

THE DURASPRING

DURASPRING SPIRAL SPRINGS

Spiral Springs are commonly used for the durable protection of ballscrews and shafts. DURASPRING Spiral Springs are produced using spring steel. The steel strip is roll formed to produce the spiral spring.

The advantages of DURASPRING are:

- High quality spring steel
- Tandem installation of multiple springs is possible
- Retrofit possible
- Special oil for enhanced life
- Production certified according to DIN ISO 9001:2015
- Anti-corrosive packaging

DURASPRING in standard and stainless steel

DURASPRING Spiral Springs are available in two versions:

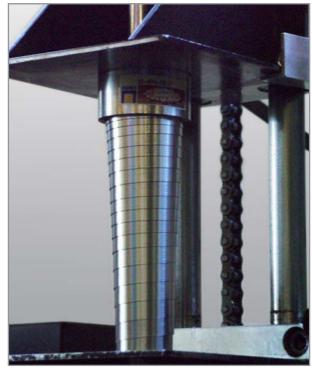

- DURASPRING BLUE standard spring, blue steel
- DURASPRING SILVER stainless steel version

If the spiral springs are exposed regularly to coolants with a high proportion of water, then stainless steel band should be used. Stainless spiral springs have lower spring forces and therefore cannot be manufactured in all sizes. We use spring band steel of extreme hardness (55-58 Rockwell) with chamfered edges and a strength of up to 1800 N/mm² for our standard spiral springs. Band steel in thicknesses from 0.2 to 1.0 mm will be selected in accordance to size and

application. Since this is docucumented within our quality system, reproducibility is also guaranteed when reordering.

DURASPRING lable with article number

Testing of DURASPRING Spiral Springs

Dimensions

The standard range now comprises springs in dimensions from 15 mm up to 160 mm internal diameter. Special dimensions are available on request. Spiral springs for vertical use can be produced up to an extended length of 4500 mm.

Speed

DURASPRING is designed as standard for speeds up to 40 metres/minute. Special solutions with almost twice the speed are achieved in individual robotics applications.

The optimum operating conditions for DURASPRING is in applications with oil. Bellows should be used alternatively for fine particles and dust.

Maintenance/Cleaning

Decisive factors in assessing the quality of spiral springs are the smoothness of travel, and even consistency of the overlapping turns. The quality of each DURASPRING is assured with the aid of our testing machines. Each spring is tested for its running properties prior to despatch.

Maintenance of the springs is necessary. Cleaning the springs according to the degree of contamination and then applying a light oil film is recommended. Available for this purpose is DURASPRING LONGLIFE special oil.

Please pay attention to the mounting and maintenance information supplied with each shipment.

DURASPRING SPIRAL SPRINGS

Installation/operating position

DURASPRING Spiral springs can be installed in both, horizontal and vertical applications:

- Horizontal installation
- Vertical installation

Our DURASPRING Spiral Springs are manufactured specifically to suit horizontal or vertical operation.

For horizontal applications, the extension is reduced (see tabulations).

Horizontal installation

Springs used horizontally are formed for particularly for uniform running in that the overlap between coils is increased. In this way »sagging« is reduced, particularly for longer extension lengths, and transverse stability is significantly improved.

In the case of horizontal installation of the springs, placing the larger diameter adjacent to the area of swarf production is recommended.

Vertical installation

As a matter of principle, vertically installed DURASPRING achieve larger extension lengths than horizontal types.

The critical design factor for this type is the force produced, as the springs must also work against gravity.

Vertical types therefore have a high starting force, guaranteeing that the DURASPRING draws out rapidly when starting/ extending with the machine movement.

For efficient protection and optimum operation, vertical spirals should be mounted with the large diameter at the top.

Flanges (optional)

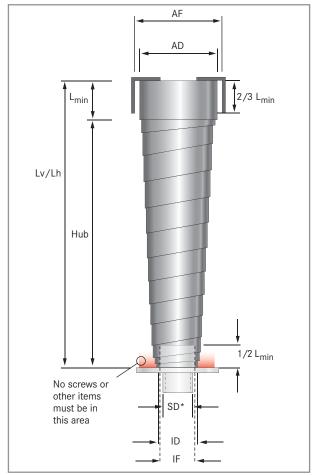

Simple centring flanges are required at both ends of the DURASPRING for installation (see order sheet).

These flanges must permit rotary movements of the spring that may occur, in order to prevent damage to the springs. The springs must be guided so that they can move freely. It is not permitted to screw and/or rivet them.

When using flanges, the spindle diameter SD is reduced by 6 mm compared to the values given on the following pages.

DURASPRING Silver in stainless steel

| Legend | |
|--------|---|
| SD | Maximum outside diameter of the part to be covered *value is reduced by 6 mm when using flanges |
| ID | Inside diameter of spiral spring (±1 mm) |
| AD | Outside diameter of spiral spring (±2 mm) |
| Lh | Maximum extension length for horizontal installation position |
